13 Qualitative data mining Consider the mining of numerical data. Usually, in machine learning used for numerical data mining, the goal is to construct a numerical function of the form $y = f(x_1, x_2, \dots)$ where y is a distinguished variable called the dependent variable, and x_1, x_2, \dots are attributes (or independent variables).

Two historical types. Two basic types of false position method can be distinguished historically, simple false position and double false position. Simple false position is aimed at solving problems involving direct proportion. Such problems can be written algebraically in the form: determine x such that $ax = b$, if a and b are known. The method begins by using a test input value x_0 , and finding ...

The negative of a positive integer is defined as a number that produces 0 when it is added to the corresponding positive integer. Negative numbers are usually written with a negative sign (a minus sign). As an example, the negative of 7 is written -7 , and $7 + (-7) = 0$. When the set of negative numbers is combined with the set of natural numbers (including 0), the result is defined as the set ...

NTSYSpc can be used to discover pattern and structure in multivariate data. For example, one may wish to discover that a sample of data points suggests that the samples may have come from two or more distinct populations or to estimate a phylogenetic tree using the neighbor-joining or UPGMA methods for constructing

dendrograms.
